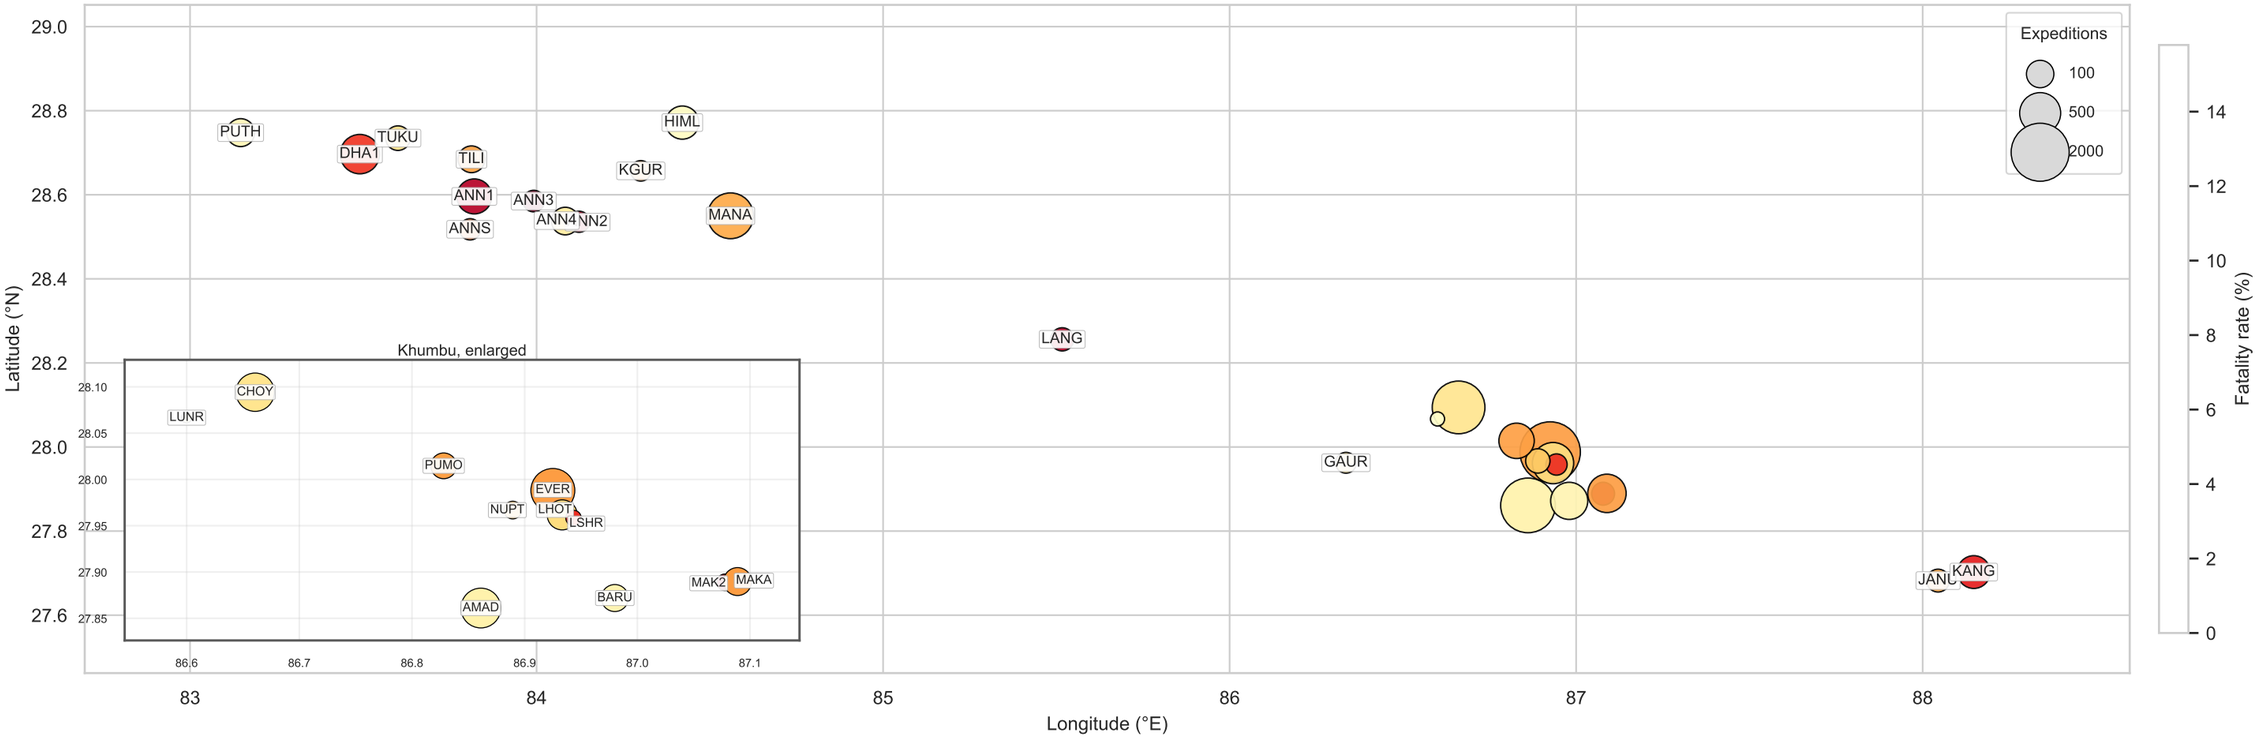
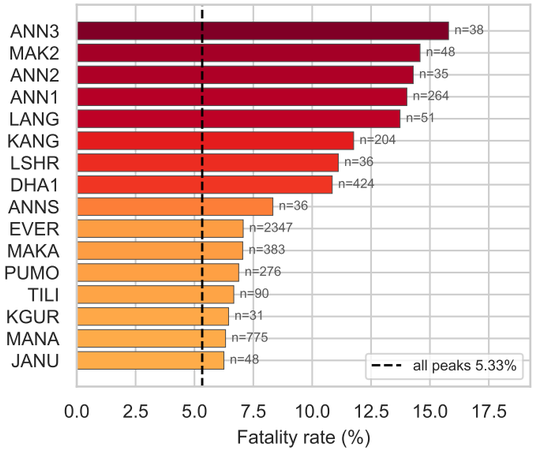
Himalayan expedition dataset — 9,457 expeditions across 27 peaks, 504 with a member death (5.33%), 1921–2024

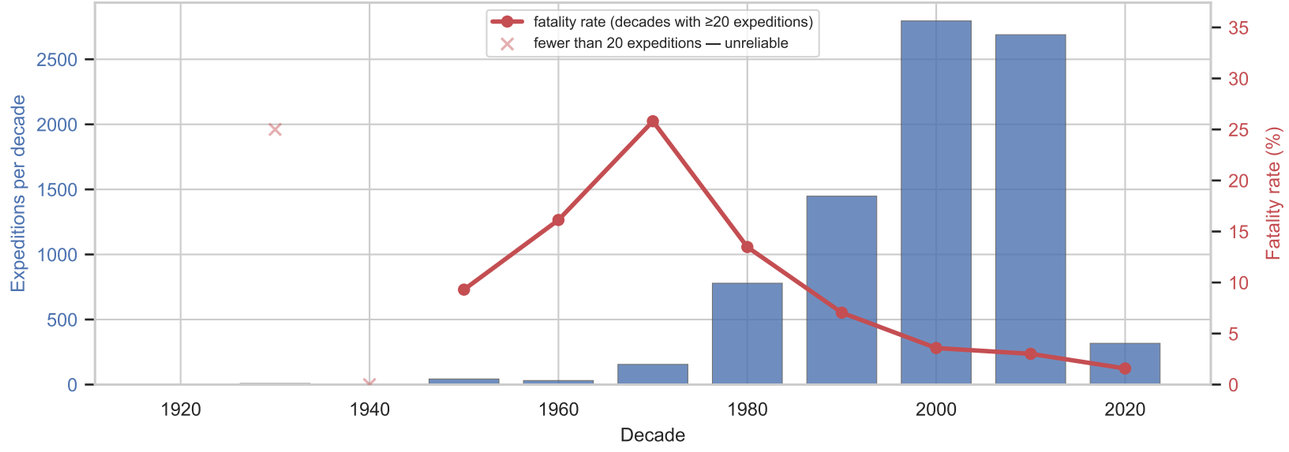
(a) Study peaks — marker area is expedition count, colour is the share of expeditions with a member death; the dense Khumbu group is labelled in the inset



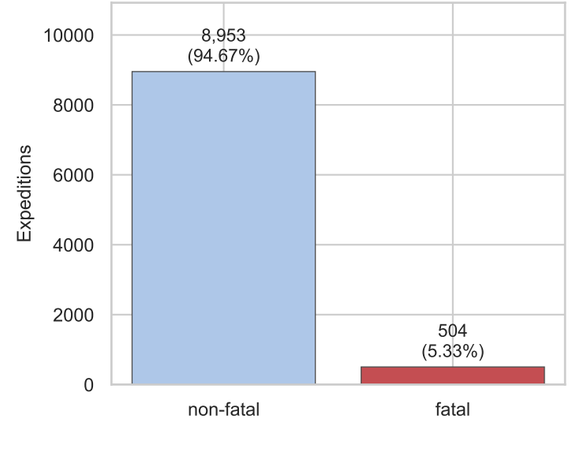
(b) Deadliest peaks by rate



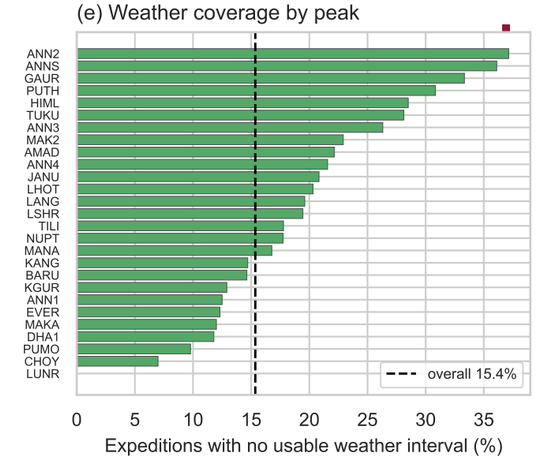
(c) Activity grew while the fatality rate fell
the distribution shift that makes chronological evaluation harder than random splitting



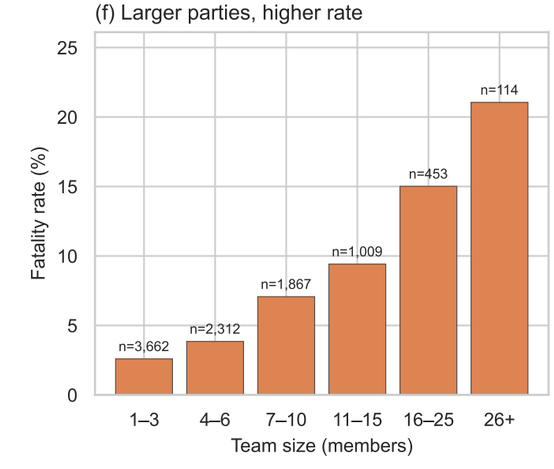
(d) Class imbalance — 17.8 : 1



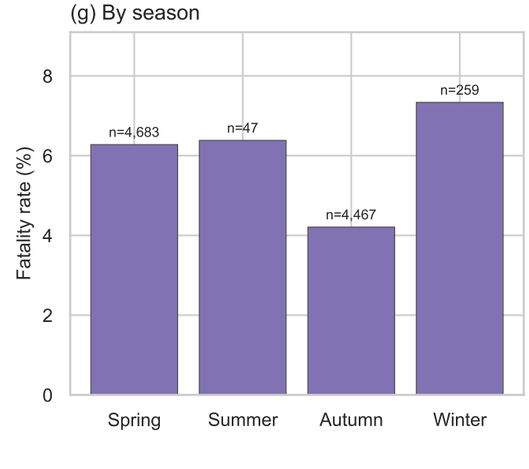
(e) Weather coverage by peak

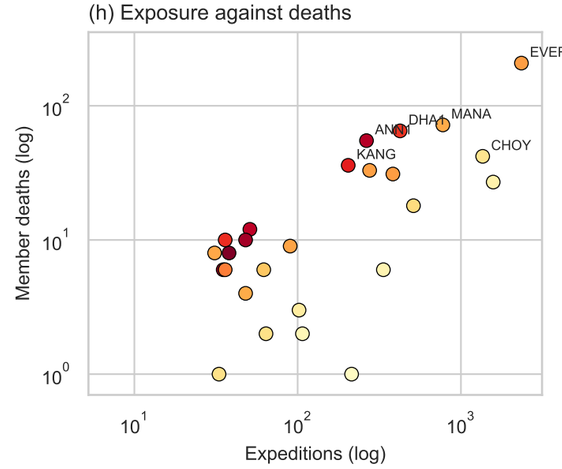


(f) Larger parties, higher rate



(g) By season





(h) Exposure against deaths
